

# RAPPORT DE STAGE SEMESTRE 8

Présenté par **Paul WALCZAK**

« **Titre du stage** »

**Rapport présenté et soutenu à « Lieu », le « date »**

## **Composition du Jury :**

Tuteur ENIB :	Alexis MICHEL	Directeur de l'ENIB
Accesneur :	Prénom NOM	ENIB
Tuteur Entreprise :	Vincent KLYVERTS TOFTERUP	Responsable du développement des drones

## **Informations Administratives :**

Entreprise :	Upteko ApS
Établissement :	École Nationale d'Ingénieurs de Brest (ENIB)
Dates :	du 06 Mars 2023 au 04 Août 2023

# REMERCIEMENTS

---

Je tiens à remercier

I would like to thank. my parents..

J'adresse également toute ma reconnaissance à ....

# COMPANY PRESENTATION

---

## 1.1 Field of activity

### 1.1.1 Wind energy

Upteko has been manually inspecting wind-turbines since 2018. Today, they are using this data and knowledge to build a system to automatically inspect wind turbines. Upteko's autonomous drone system will provide high-quality aerial data for all inspections and maintenance requirements, in a safer, more efficient manner, without causing operational downtime. Their drones are pre-programmed with geo-referenced 3D trajectories for the inspection of wind turbines. While flying the planned routes, several images are acquired. The actual number depends on the camera specification, flight altitude and post-processing performance (overlap between images). All images are georeferenced using the UAV position at the acquisition time and these images are afterwards stitched together and in one picture on which the locations of the damages are shown. They deliver these data as per the clients' requirements in raw files or provide a damage report that explains the severity of damages from type 1 to type 5.

### 1.1.2 Oil and Gas

Upteko is working on a solution for detecting oil spills on the surface of the water. They are developing payloads for their drone system that can help detect the signature of oil floating on water surfaces. This payload can be installed on Lärke and can be used to automatically or manually detect oil spills. Upteko have developed an application to detect pirate attacks on off-shore oil rigs and large commercial ships. Pirates use small ships to attack these oil rigs and large commercial ships at night. They take the crew and contents hostage. There are no mobile long-range detection tools with aerial insight to give the crew information about nearby pirates. This results not only in huge loss to the

oil industry but also endangers the crew at huge life risks. The total cost of piracy to the shipping industry, from insurance and time lost, is estimated at over €6B/year. Upteko's multipurpose drone system has a feature called perimeter control. This feature allows any member of the crew to investigate surrounding vessels approaching the premises. A built-in feature within the drone system is added to allow a crew member to operate and control the aerial camera in any direction with no prior drone experience. The geothermic cameras and the infrared sensors help to detect the approach of any pirates faster even during night-time.

### **1.1.3 Offshore and Maritime**

Upteko has been consistently involved with the maritime industry since its inception. They are developing a drone system solution to live on the ship, to connect port operations on the ground and at the sea, with insight from the sky. This system includes a drone and a charging station for the drone that will be installed on the ship. The drone can autonomously perform a variety of tasks and then fly back and charge its batteries while staying protected against the weather. With an in-depth understanding of the challenges that the maritime industries face in attempting long and expensive inspections and other operational tasks, Upteko's software and hardware drone system allows a 100% automatic inspection of a ship in less than 2 hours. Having a permanent drone on a ship will be extremely helpful in a number of cases that can range from Search and Rescue (SAR) operations, vessel docking, dry dock inspections, fire hazard detection and situational awareness among other functionalities.

## **1.2 History**

Upteko<sup>TM</sup> was founded in 2018 by Mads Joergensen, Benjamin Mejnertz, and Sebastian Duus to pursue the opportunity of developing drone applications for the maritime sector. For Benjamin and Sebastian, it started as a hobby, competing in RC Helicopter competitions around the world and later became a business worth pursuing. Mads came onboard, and together they created Upteko and built a great team of experienced drone pilots, software- and hardware engineers, and business developers. Today Upteko has offices located in Copenhagen, Odense, and Skanderborg. Upteko is about using their creativity and initiative to become leaders in the drone industry. To develop fitting solutions to your

needs, they value collaboration and co-creation highly among external parties. Through several years of collaborating with their customers, complementary assets providers, and even competitors, they have achieved priceless partnership within the maritime and other sectors. They are continuously on the hunt for new collaborations.

### **1.3 Legal and social model**

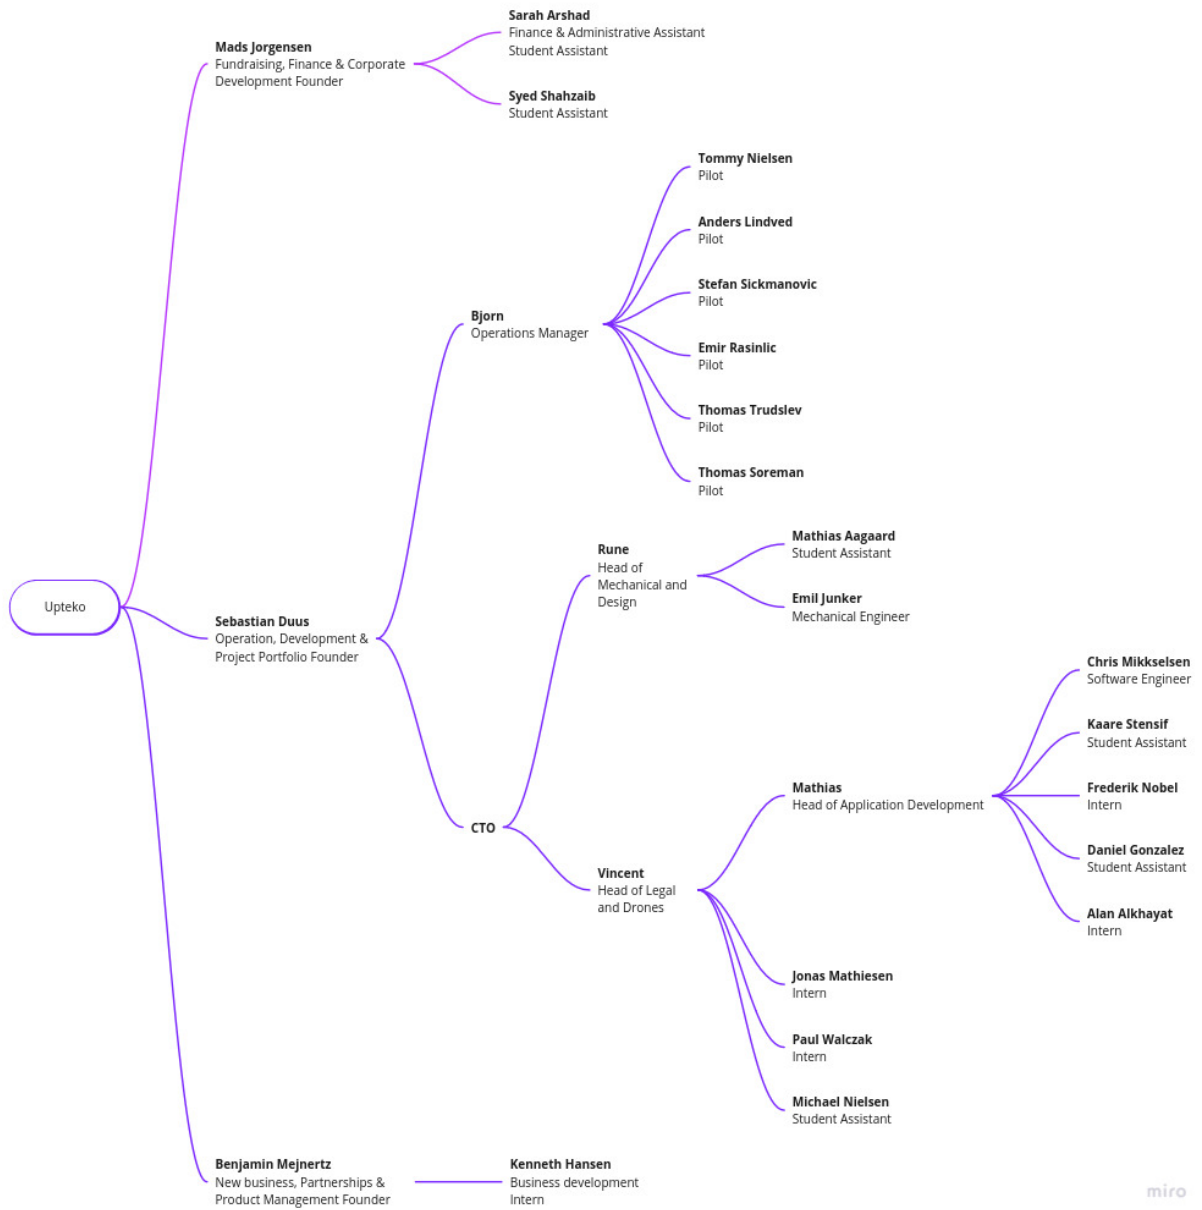

In Denmark, most companies operate under a legal structure of a private limited company (Anpartsselskab, ApS) as Upteko. The country has strong social welfare systems and labor laws, which mandate fair treatment and protection of employees. Danish companies usually have a strong focus on maintaining a healthy work-life balance and uphold high ethical standards, both socially and environmentally.

### **1.4 Economic model**

Denmark follows a mixed-market capitalist system, combining free market principles with a strong regulatory oversight. Upteko operates under a model of sustainable growth, focusing on long-term stability rather than short-term profits. This includes social responsibility, ethical business practices, and environmental sustainability.

### **1.5 Type of work organization**

Denmark has a distinctive workplace culture, often characterized by a flat organizational structure. This implies low power distance, high levels of trust, and extensive collaboration between different levels of the organization. Danish companies typically have strong communication and decision-making practices, promoting employee empowerment and autonomy. Upteko is organised in three main sectors : **Technical Development** , **Finance** and **Product management** . Here is the actual organization chart of the company :

miro

# PROJECTS

## 2.1 STM32 IMU

### 2.1.1 PModNav

The purpose is to get the **roll**, **pitch** and **yaw** from the PModNav to plot a 3D visualization of the IMU. The final purpose of it is to create log files from the orientation and attitude of the drone in real-time. By combining data from accelerometers, gyroscopes and magnetometers, an IMU can provide information about the object's position, orientation and angular velocity. This is crucial for tasks such as safety deployment or drone tracking. The STM32-L4796ZG recovers the value of the sensors from the **PModNav** via **SPI Bus** and transmits them to the HMI via **UART** connection.

## Hardware

The PModNav module is equipped with the LSM9DS1 sensor, offering 10-degrees-of-freedom (10-DOF) functionality. It integrates a 3-axis accelerometer, 3-axis gyroscope, 3-axis magnetometer, and an LPS25HB digital barometer. This comprehensive sensor suite allows users to obtain orientation-related data and determine the precise position and heading of the module. The module supports various full-scale options for linear acceleration, angular rate, and magnetic field measurements. It follows the Digilent Interface Specification Type 2A and utilizes a 12-pin Pmod connector with an SPI interface.

## Software and Development Environment

The development environment for the PModNav project is STM32 CubeIDE. The documentation references project sources, including code snippets and libraries, such as the PModNav driver and Madgwick's filter implementation.

## Data Processing

The project outlines two approaches for deriving object attitudes : Euler angles and quaternions. Euler angles are obtained through the integration of angular velocity and provide information about the roll, pitch, and yaw of an object. However, a challenge known as "Gimbal Lock" arises when using Euler angles directly, resulting in a loss of a degree of freedom when two axes of rotation overlap. To overcome this, quaternions are introduced as a mathematical representation of displacement and rotation. They effectively resolve the Gimbal Lock issue and provide a more robust solution for determining attitudes.

$$Q = [q_0, q_1, q_2, q_3]$$

$$R_{12} = 2.(q_1.q_2 + q_0.q_3)$$

$$R_{22} = q_0^2 + q_1^2 - q_2^2 - q_3^2$$

$$R_{31} = 2.(q_0.q_1 + q_2.q_3)$$

$$R_{32} = 2.(q_1.q_3 - q_0.q_2)$$

$$R_{33} = q_0^2 - q_1^2 - q_2^2 + q_3^2$$

Calculation of the Euler Angles from the rotation matrix :

$$roll = atan2(R_{12}, R_{22})$$

$$pitch = atan2(R_{31}, R_{33})$$

$$yaw = asin(R_{32})$$

### 2.1.2 Graphical User Interface

Additionally, a graphical user interface (GUI) is provided, leveraging PyQt5 and PyOpenGL modules. The GUI manages the main window and handles OpenGL object management. It offers features like port selection and serial communication. The received data is displayed in a textbox within the GUI, facilitating real-time monitoring and analysis. Here is how the GUI is threaded :

The use is rather simple for the communication configuration (cyan box) :

- the port
- the baud rate

- the number of bits per frame
- the number of stop bits
- the parity
- the flow control

Then click on **Connect** to start the serial communication. Every received line appeared in the textBox (**red box**).

### 2.1.3 Final result

## 2.2 LogViewer

## 2.3 Collision avoidance SITL

# **TEMPORAL ORGANIZATION OF TASKS - GANTT**
